```
            <command> [<args>]

These are common Git commands used in various situations:

start a working area (see also: git help tutorial)
   clone       Clone a repository into a new directory
   init        Create an empty Git repository or reinitialize an existing one

work on the current change (see also: git help everyday)
   add         Add file contents to the index
   mv          Move or rename a file, a directory, or a symlink
   restore     Restore working tree files
   rm          Remove files from the working tree and from the index

examine the history and state (see also: git help revisions)
   bisect      Use binary search to find the commit that introduced a bug
   diff        Show changes between commits, commit and working tree, etc
   grep        Print lines matching a pattern
   log         Show commit logs
   show        Show various types of objects
   status      Show the working tree status

grow, mark and tweak your common history
   backfill    Download missing objects in a partial clone
   branch      List, create, or delete branches
   commit      Record changes to the repository
   merge       Join two or more development histories together
   rebase      Reapply commits on top of another base tip
   reset       Reset current HEAD to the specified state
   switch      Switch branches
   tag         Create, list, delete or verify a tag object signed with GPG

collaborate (see also: git help workflows)
   fetch       Download objects and refs from another repository
   pull        Fetch from and integrate with another repository or a local branch
   push        Update remote refs along with associated objects

'git help -a' and 'git help -g' list available subcommands and some
concept guides. See 'git help <command>' or 'git help <concept>'
to read about a specific subcommand or concept.
See 'git help git' for an overview of the system.
